Education:

Bachelor of Science in Computer Science | Kennesaw State University | GPA: 3.75/4.0; UPE Member May 2026

Coursework: Data Structures & Algorithms, Operating Systems, Database Management Systems, Parallel & Distributed Computing, Software Architecture & Design, Cloud Software Development, Artificial Intelligence, Mobile Software Development, Machine Vision

Skills:

- **Languages:** Python, Java, C/C++, TypeScript, JavaScript, SQL, Kotlin
- **Backend:** Spring Boot, FastAPI, Node.js, REST APIs, Microservices, Apache Kafka, OpenAPI/Swagger, OAuth/JWT, Async Processing
- **Cloud & Databases:** AWS (EC2, S3, RDS, Lambda), PostgreSQL, MySQL, SQLite, Supabase, Firebase
- **AI & Data:** RAG Pipelines, FAISS, Vector Search, Embeddings, OpenAI APIs, Gemini, Prompt Engineering
- **Tools & DevOps:** Docker, Kubernetes, Prometheus, Grafana, Git, GitHub Actions, CI/CD, Postman, JUnit, pytest
- **Concepts:** Distributed Systems, Event-Driven Architecture, System Design, Object-Oriented Design, Software Architecture, Data Modeling
- **Frontend:** React, Next.js, Tailwind CSS

Work Experience:

Software Engineer Intern | LexisNexis Risk Solutions, Alpharetta, GA May 2025 – Jul 2025

- Owned design and integration of an AI-powered QA Copilot that automated test-case generation across **8+ backend workflows**, increasing test coverage by **~30%** and cutting manual test-authoring time by **~40%**.
- Built and executed automated REST API validation across **50+ endpoints** with Postman, preventing configuration regressions and improving release confidence for Jira-driven platform changes.
- Authored **15+ pages** of technical documentation, runbooks, and handoff guides, enabling QA and platform teams to independently own the Copilot after the internship.
- Improved release quality for customer-facing risk and compliance workflows by reducing defects introduced during configuration and deployment changes.

Projects:

FlowCommerce: Distributed Order Processing Platform | Python, FastAPI, Kafka, PostgreSQL, Stripe, React | [Live Link](#)

- Built an event-driven platform of **7 Python/FastAPI** microservices on Kafka using saga choreography; load-tested at **173 orders/sec** intake with **0 lost** and **0 duplicate** orders across **17K+** requests.
- Engineered exactly-once-style reliability with a transactional outbox and idempotent consumers, eliminating dual-write loss and double-charges under at-least-once delivery.
- Verified automatic saga rollback under a **20%** payment-failure rate with real Stripe PaymentIntents: **0 lost**, **0 duplicate**, and **100%** of failed-order inventory released.
- Instrumented every service with Prometheus/Grafana and correlation-ID tracing, plus an admin operations console and an AI ops copilot for incident triage.

LearnBot: Retrieval-Augmented AI Learning Assistant | FastAPI, FAISS, RAG Pipelines, REST APIs | [Live Link](#)

- Built a **13-endpoint** FastAPI backend powering a retrieval-augmented generation pipeline that ingests PDFs and web pages, splits them into **1000-character** overlapping chunks, embeds them with **3072-dim** Gemini embeddings, and indexes them in a FAISS vector store for source-grounded answers with citations.
- Engineered semantic retrieval that pulls the **top-50 nearest-neighbor chunks** per query (benchmarked at **sub-10 ms p95** over a **10,000-vector index**) and narrows to **6 cited context blocks**, then generates chat answers, quizzes, and flashcard decks from the same sources.
- Designed per-user vector isolation, Supabase JWT authentication, and a layered storage model across S3, Supabase, and SQLite for secure multi-user document management.

AI Closet: Smart Outfit Recommendation System | Next.js, TypeScript, OpenAI Vision, Tailwind CSS | [Live Link](#)

- Built a recommendation engine that scores outfits on **12 weighted features** including style coverage, color harmony, weather fit, and feedback signals, validated through an evaluation harness across **600 generated recommendations**.
- Integrated OpenAI Vision to auto-extract clothing attributes (category, color, style) from uploaded images without manual labeling, paired with a weather API for context-aware suggestions.
- Designed relational schemas with row-level security and API workflows for efficient retrieval and synchronization of user wardrobe and recommendation data.

Ticket Management System | Node.js, REST APIs, Async Workflows, Email Infrastructure | [Live Link](#)

- Built a full-stack ticketing platform with **14 REST endpoints** across public, user, and admin scopes, handling purchases, live ticket-availability checks, per-ticket record generation, and an admin dashboard that aggregates revenue and tickets sold.
- Isolated transactional email so a failed notification never blocks a completed purchase, and configured a verified custom sending domain with SPF, DKIM, and DMARC for authenticated, reliable delivery.
- Implemented ticket validation with used-state tracking and admin role enforcement to prevent duplicate redemption and unauthorized access.

Mindful Journaling App | Next.js, TypeScript, Supabase, OpenAI API, Tailwind CSS, Vercel | [Live Link](#)

- Built a full-stack journaling platform (Next.js, Supabase, PostgreSQL) with email and Google OAuth, mood tracking, tagging, and a calendar view, all scoped per user with row-level security.
- Built a mood-trend engine that aggregates journal entries across **5 time windows** (7-day, weekly, monthly, 30-day, and per-month) in a single pass to power dashboard insights.
- Integrated **4 AI endpoints** (OpenAI GPT-4.1-mini) for journal prompts, reflections, contextual chat, and mood insights, with a sparse-data guard that skips calls until enough entries exist to avoid misleading output.
